2-Majority Element

Given an array nums of size n, return *the majority element*.

The majority element is the element that appears more than ⌊n / 2⌋ times. You may assume that the majority element always exists in the array.

Example 1:

Input: nums = [3,2,3]

Output: 3

Example 2:

Input: nums = [2,2,1,1,1,2,2]

Output: 2

Constraints:

- n == nums.length
- $1 <= n <= 5 * 10^4$
- $-2^{31} <= nums[i] <= 2^{31} - 1$

For example:

Input	Result
3 3 2 3	3
7 2 2 1 1 1 2 2	2

Answer:(penalty regime: 0 %)

```
#include<stdio.h>
int main(){
   int n;
   int max = -1;
```

```
    scanf("%d",&n);
    int nums[n];
    for(int i = 0 ; i<n ; i++){
        scanf("%d",&nums[i]);
    }
     for(int i = 0 ; i<n ; i++){
        if(nums[i]>max){
            max = nums[i];
        }
    }
    printf("%d",max);
    return 0;

}
```

Feedback

	Input	Expected	Got	
	3 3 2 3	3	3	

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.
